## Definitions of the SI Base Units

**Metre (m):** The metre, symbol m, is the SI unit of length. It is defined by taking the fixed numerical value of the speed of light in vacuum  $c$  to be  $299792458$  when expressed in the unit  $\text{ms}^{-1}$ , where the second is defined in terms of the caesium frequency.

**Kilogram (kg):** The kilogram, symbol kg, is the SI unit of mass. It is defined by taking the fixed numerical value of the planck constant  $h$  to be  $6.62607015 \times 10^{-34}$  when expressed in the unit  $\text{Js}$ , which is equal to  $\text{kgm}^2\text{s}^{-1}$ , where the metre and the second are defined in terms of  $c$  and  $\Delta V_{\text{Cs}}$ .

**Second (s):** The symbol s, is the SI unit of time. It is defined by taking the fixed numerical value of the caesium frequency  $\Delta V_{\text{Cs}}$ , the unperturbed ground-state hyperfine transition frequency of the caesium-133 atom, to be  $9192631770$  when expressed in the unit Hz, which is equal to  $\text{s}^{-1}$ .

**Ampere (A):** The ampere, symbol A, is the SI unit of electric current. It is defined by taking the fixed numerical value of the elementary charge  $e$  to be  $1.602176634 \times 10^{-19}$  when expressed in the unit  $\text{C}$ , which is equal to  $\text{As}$ , where the second is defined in terms of.

**Kelvin (K):** The Kelvin, symbol K, is the SI unit of thermodynamic temperature. It is defined by taking the fixed numerical value of the Boltzmann constant  $K$  to be  $1.380649 \times 10^{-23}$  when expressed in the unit  $\text{JK}^{-1}$ , which is equal to  $\text{kgm}^2\text{s}^{-2}\text{K}^{-1}$ , where the kilogram, metre and second are defined in terms of  $h$ ,  $c$  and  $\Delta V_{\text{Cs}}$ .

**Mole (mol):** The mole, symbol mol, is the SI unit of amount of substance. One mole contains exactly  $6.02214076 \times 10^{23}$  elementary entities. This number is the fixed numerical value of the Avogadro constant,  $N_A$ , when expressed in the unit  $\text{mol}^{-1}$  and is called the Avogadro number. The amount of substance, symbol n, of a system is a measure of the number of specified elementary entities. An elementary entity may be an atom, a molecule, an ion, an electron, any other particle or specified group of particles.

**Candela (cd):** The candela, symbol cd is the SI unit of luminous intensity in a given direction. It is defined by taking the fixed numerical value of the luminous efficacy of monochromatic radiation of frequency  $540 \times 10^{12}$  Hz,  $K_{\text{cd}}$ , to be 683 when expressed in the unit  $\text{lm}\cdot\text{W}^{-1}$ , which is equal to  $\text{cd}\cdot\text{sr}\cdot\text{W}^{-1}$ , or  $\text{cd sr kg}^{-1}\text{m}^{-2}\text{s}^3$ , where the kilogram, metre and second are defined in terms of  $h$ ,  $c$  and  $\Delta V_{\text{Cs}}$ .

(The symbols listed here are internationally agreed and should not be changed in other languages and scripts.

**Temperature****SI Base Unit: Kelvin (K)**

K = -273.15°C  
 K = °C + 273.15  
 °F = 1.8°C + 32  
 $\text{°C} = \frac{\text{°F} - 32}{1.8}$

\* Force: 1 newton (N) = 1 kg m/s<sup>2</sup>, i.e., the force that, when applied for 1 second, gives a 1-kilogram mass a velocity of 1 metre per second.

\*\* The amount of heat required to raise the temperature of one gram of water from 14.5°C to 15.5°C.

† Note that the other units are per particle and must be multiplied by  $6.022 \times 10^{23}$  to be strictly comparable.

\*The entropies of individual ions in solution are determined by setting the entropy of H<sup>+</sup> in water equal to 0 and then defining the entropies of all other ions relative to this value; hence a negative entropy is one that is lower than the entropy of H<sup>+</sup> in water.
